

Questions & answers from Nordea's vendor webinar 1 June 2016 about Nordea's Secure Envelope:

This seems to be some kind of AUTACK implementation for ISO20022 files. Why has Nordea chosen this solution instead of regular SOAP web services with WS-Security?

Secure Envelope is not like AUTACK. AUTACK is for identification purposes and inside the file, meaning it can be used only with agreed file types (PAYMYL, DD). With Secure envelope it is possible to transport any file types, even binary files without changes to any part of the structure. The technical feedback is a generic feedback, that has to work for several different protocols (sFTP, AS2 etc) and manual file transfer additional to Web Services, which uses the SOAP protocol. By that response can work separated from the communication channel, used offline, instead of being tied into SOAP protocol.

Compression is optional and seems not work in the test tool?

Compression is currently not supported by the tool, however it is definitely in our plans, and we expect to implement the feature in the autumn.

In 2018 DFØ (Direktorat for Økonomistyring/Norwegian Government Agency for Financial Management) will have specific demands regarding securing the ISO20022 XML. Does Nordea know which standard DFØ will require?

DFØ is the party acting on behalf of the governmental customers to put forward requirements towards the banks in the RfP process. The current agreement with the government expires end 2018. New agreements will take effect end 2018/beginning of 2019. They earlier informed that for the next RfP process they would have specific requirements when it comes to securing the ISO20022 XML files. And they have now decided that they will require their banks to support CEF eDelivery.

You can read more about this by clicking the links below (redirect to external sites):

DIFI (Agency for Public Management and eGovernment) held an information meeting about the topic last week. More information about their requirements can be found here:

<https://www.anskaffelser.no/ehf-formater-innhold/ehf-brukerforum/difi-informasjonsmote-om-iso20022-og-edelivery>

In Nordea we will start looking into the requirements and evaluate needed development.
