

**Capital adequacy and risk management  
(pillar 3)  
Nordea Group**

# Executive summary

From the beginning of 2007 the new Capital Requirements Directive (CRD) is effective as the common framework for implementing the Basel II framework in EU. Nordea has chosen a stepwise roll-out plan for the different credit portfolios. Nordea received approval from the Nordic Financial Supervisor Authorities June 2007 to use the Foundation Internal Rating Based approach (FIRB) for its corporate and institutional portfolios. These portfolios account for 53% of Nordea's capital requirement for the credit risk. For the remaining part of the credit portfolio Nordea uses the standardised approach. For market risk both the internal model approach and the standardised approach are used. For operational risk the standardised approach is used.

As step 2, Nordea has applied for permission to use the IRB approach for the retail portfolios.

This is Nordea's first so called pillar 3 report and it contains a description of risk and capital management in Nordea, including detailed information of the capital adequacy process. The disclosed RWAs, Tier 1 ratios and Total Capital ratios are in accordance with the Minimum Capital Requirements (Pillar 1).

The second pillar in the CRD is the Supervisory Review Process, which should ensure that an institution's Internal Capital Adequacy Assessment Process (ICAAP) clearly identifies material risk and that adequate capital is allocated here fore. Pillar 2 also includes the evaluation of the capital adequacy made by the Financial Supervisory Authorities.

The third pillar in the CRD refers to the public disclosure on risk and capital management, including how and when an institution will disclose information on risk and capital management. This information is provided in the pillar 3 report. Nordea's disclosure is given in accordance with the requirements given by the Swedish Financial Supervisory Authority (Finansinspektionen).

Nordea assesses these reports as important contribution to an increased risk transparency within the banking industry, in particular valuable under market conditions characterised by high uncertainty.

Nordea's total RWA as of end December 2007 amounted to EUR 205bn, affected by the existing transition rules. Excluding transition rules RWA would have amounted to EUR 171bn.

Credit exposure totalled EUR 429bn, including off-balance sheet exposure. The credit risk accounts for approximately 92%, operational risk 6% and market risk 2% of the capital requirement.

Out of the total capital requirements for credit risk, 53% have been calculated with the IRB approach, 43% with the standardised approach and 4% with the previous regulatory framework (Basel I). Nordea Bank Polska S.A., Nordea Bank S.A. (Luxemburg) and JSB Orgresbank (Russia) are during 2007 reporting in accordance with Basel I. Approx. 19% of the corporate exposure of EUR 198bn is secured by collateral which in the capital adequacy are eligible for credit risk mitigation.

Nordea aims at a tier 1 capital ratio above 6.5% and a total capital ratio not lower than 9.0%. At the end of 2007 Nordea's tier 1 capital ratio was 7.0% and total capital ratio was 9.1%. Excluding transition rules the numbers were 8.3% and 10.9% respectively.

In addition to regulatory requirements, Nordea has internal capital requirements based on the Economic Capital framework, which includes risk in Nordea's life insurance operations, as well as other risk types.

# 1. Introduction

From the beginning of 2007, the new Capital Requirements Directive (CRD) came into effect as the common framework for implementing the Basel II framework in EU. The CRD is built on three pillars:

- Pillar 1 – requirements for the calculation of the Risk Weighted Amounts (RWA) and capital requirement
- Pillar 2 – rules for the Supervisory Review Process (SRP), including the Internal Capital Adequacy Assessment Process (ICAAP)
- Pillar 3 – rules for the disclosure of risk and capital management, including capital adequacy

Basel II is an international initiative with the purpose to implement a more risk sensitive framework for the assessment of risk for the calculation of regulatory capital, i.e. the minimum capital that the institution must hold. The intention is also to align the actual assessment of risk within the institutions with the assessment of the regulatory capital by allowing use of internal models. The CRD contains a detailed set of minimum requirements to assure the conceptual soundness and integrity of the internal assessment. The CRD will have a stepwise effect on the institutions through the transitional rules limiting the possible reduction of capital requirement. The full effect will occur after the transition rules period (January 2010).

## 1.1 Pillar 1

The new CRD is not changing the minimum required capital ratio of 8% compared to the previous regulation (Basel I). The changes are related to the definition and calculations of the RWA, which is the method used to measure the risk exposure of the reporting institution. The regulatory capital requirements are calculated using the following formula:

---

**Minimum capital requirements = Capital base / RWA**

where,

**Minimum capital requirements  $\geq$  8%**

---

The RWAs are calculated by using more sophisticated and risk sensitive methods than previously. Credit risk and market risk are two essential risk types like in Basel I, while operational risk is introduced as a new risk type in the CRD. The table 1 identifies the approaches available for calculating RWA in each risk type in accordance with the CRD:

Table 1: Primary approaches in the CRD

Approaches for reporting capital requirements		
Credit Risk	Market Risk	Operational Risk
(1) Standardised Approach	(1) Standardised Approach	(1) Basic Indicator Approach
(2) Foundation Internal Rating Based Approach (FIRB)	(2) Internal Models Approach	(2) Standardised Approach
(3) Advanced Internal Rating Based Approach (AIRB)		(3) Advanced Measurement Approach

Nordea is using both the standardised approach and the Foundation Internal Rating Based approach (FIRB) for calculation of credit risk. The standardised approach for calculating credit risk is close to the previous Basel I regulation, except an additional possibility to use external rating for the counterparties and wider use of financial collateral. The RWA is set by multiplying the exposure with a risk weight factor dependent on the external rating and exposure class. Credit risk according to FIRB is based on the internal rating and Probability of Default (PD) for each counterpart and fixed estimates for Loss Given Default (LGD) and Credit Conversion Factors (CCF). For market risk, Nordea is using both the internal model approach, in which VaR models are applied, and the standardised approach. Nordea is using the standardised approach for operational risk.

In order to prevent large short-term effects on capital requirements, the regulators have introduced transitions rules (also known as capital floor) for all institutions implementing the new capital adequacy reporting. The transitional rules, in force 2007-2009, mark the lowest eligible capital base and relate directly to the capital requirements calculated under Basel I regulations. During 2007 the capital requirements should be no less than 95% of the capital requirements calculated under Basel I regulations. For 2008 and 2009 the amounts of capital requirements are allowed to be 90% and 80% respectively of the capital requirements calculated under Basel I regulations.

## 1.2 Pillar 2

Pillar 2, or the Supervisory Review Process (SRP), comprises two processes:

- the Internal Capital Adequacy Assessment Process (ICAAP) and
- the Supervisory Review and Evaluation Process (SREP).

The SRP is designed to ensure that institutions identify their material risk and allocate adequate capital, and employ sufficient management processes, to support such risk. The SRP also encourages institutions to develop and use better risk management techniques in monitoring and measuring risk in addition to the credit, market and operational risk in the CRD. The ICAAP allows banks to review their risk management policies and capital positions relative to the risk they undertake. Nordea builds its ICAAP around its Economic Capital framework to ensure that the institution has sufficient available capital to meet regulatory and internal capital requirements, even during periods of economic or financial stress. The ICAAP includes all components of Nordea's risk management, from daily risk management of material risk to the more strategic capital management of the entire Group and its legal entities. The SREP is the supervisor's review of Nordea's capital management and an assessment of Nordea's internal controls and governance.

Other risk types, which are not covered by the minimum capital requirements according to pillar 1, are liquidity risk, business risk, interest rate risk in the non-trading book and concentration risk. These are covered either by capital or risk management and mitigation processes under pillar 2.

## 1.3 Pillar 3

In the CRD it is also stipulated how and when institutions should disclose capital and risk management. The disclosure should follow the rules according to the pillar 3. Nordea follows the Swedish Capital adequacy and large exposures act (2006:1371) and the Swedish Financial Supervisory Authority's regulation and general guidelines regarding public disclosure of information concerning capital adequacy and risk management (FFFS 2007:5), which are based on the CRD.

In this report, Nordea discloses a description of the different risk types in its balance sheet as well as off-balance sheet risk and the management of the risk and capital in accordance with the pillar 3 rules. The presentation follows the structure below:

- Description of the Group structure and overall risk and capital management
- Regulatory capital requirements
- Credit risk, including exposure, RWA calculations, and loan losses
- Market risk
- Operational risk
- Off-balance, including risk in derivatives and securitisation
- Internal capital, including other risk types
- Capital adequacy conclusions, including a description of the capital base

Further details and disclosure of risk, liquidity and capital management are presented in the annual report in accordance with the international financial reporting standards, IFRS.

The pillar 3 disclosure is made for the Nordea Group and for the subgroups Nordea Bank Danmark Group, Nordea Bank Finland Group and Nordea Bank Norge Group as well as Nordea Bank Polska S.A. The report for the Nordea Group and the reports for the subgroups are presented on [www.nordea.com](http://www.nordea.com) and the key data on capital adequacy is presented in the annual report of respective legal entity.

The full pillar 3 disclosure will be made annually and the periodic information will be published quarterly, included in the quarterly report for the entity. The format, frequency and content of the disclosures follow, to as large extent as possible with regards to the local legislation, a common set-up in Nordea. Group Corporate Centre has stated the common principles in a policy and instructions for disclosing information on capital adequacy in the Nordea Group.

## 2. Risk and capital management in Nordea

In this chapter, the consolidation principles for the capital base within Nordea are described as well as the principles for management and control of risk and capital.

### 2.1 Nordea in the capital adequacy context

The financial statements are published quarterly and the consolidated financial statements include the accounts of the parent company Nordea Bank AB (publ), with corporate registration number 516406-0120, including subsidiaries according to IAS 27.

According to the requirements in the CRD, insurance subsidiaries and associated undertakings with financial operations, are deducted from the capital base in the capital adequacy reporting (e.g. credit institutions or insurance companies where Nordea own 10% or more of the capital). Table 2 includes information of what undertakings that have been consolidated and deducted from the capital base.

Table 2: Specification over group undertakings consolidated/deducted from the capital base, 31 December 2007

	Number of shares	Book value EURm	Voting power of holding %	Domicile	Consolidation method

*Investments in joint venture*

The Group has a 50% interest in two joint ventures, DNP Ejendomme P/S and Ejendomsselskabet af 1. marts 2006 P/S, which are real estate companies. These companies are included using the proportionate method.

*Associated undertakings not accounted for using the equity method*

The 40 percent holding in Nordic Processor AB is not accounted for using the equity method, due to that the terms in the agreement, with the joint owner IBM leads to that Nordea does not have significant influence.

## 2.2 Risk and capital management

Nordea aims for overall balanced risk taking in order to enhance shareholder value. The Board of Directors has the ultimate responsibility for deciding on limits for and monitoring the Group's risk exposure. The Board of Directors also has ultimate responsibility for setting the targets for the capital ratios. Risk in Nordea is measured and reported according to common principles and policies approved by the Board of Directors. The Board of Directors decides on policies for credit, market, liquidity and operational risk management as well as the internal capital adequacy assessment process. All policies are reviewed at least annually.

*Roles and responsibilities*

The Chief Executive Officer (CEO) and Group Executive Management (GEM) regularly review reports on risk exposures and have established the following committees for risk and capital management:

- The Asset and Liability Committee (ALCO), chaired by the CFO, prepares issues of major importance concerning the Group's financial operations, financial risk as well as capital management for decision by CEO in GEM.
- Capital Planning Forum, chaired by the CFO, monitors the development of the required (internal and regulatory) capital, the capital base and decides also upon capital planning activities.

- The Risk Committee, chaired by the CRO, monitors developments of risk on aggregated level. The CRO is also head of Group Credit and Risk Control.
- The Executive Credit Committee (ECC) and the Group Credit Committee (GCC), chaired by the CRO, decide on major credit risk limits and industry policies for the Group. Credit risk limits are granted as individual limits for customers or consolidated customer groups and as industry limits for certain defined industries.

Other credit risk limits, which are not decided by the ECC or the GCC, are determined by decision-making authorities on different levels in the organisation.

The Chief Risk Officer (CRO) is responsible for the credit, market, operational and liquidity risk management framework, for the development, validation and monitoring of the rating systems, the credit policy and strategy, the credit instructions, as well as the credit approval process and credit control processes.

The Chief Financial Officer (CFO) is responsible for the capital planning process including capital adequacy reporting, Economic Capital and parameter estimation (i.e. Probability of Default and Loss Given Default) used for the calculation of RWA. The CFO is further responsible for liquidity and balance sheet management.

In figure 1, the governance structure of risk and capital management in Nordea is illustrated. Within the Group, two separate functions, Group Credit and Risk Control and Group Corporate Centre, are responsible for risk, liquidity and capital management. Group Credit and Risk Control is responsible for the Group's risk management framework, consisting of policies, instructions and guidelines, whereas Group Corporate Centre is responsible for the capital management and liquidity framework including required capital as well as capital base.

Figure 1: Governance of Risk, Liquidity and Capital Management

### 2.2.1 Different risk types

There are different risk types which are described more in detail below in accordance with how they are structured within CRD. The risk in insurance operations is not covered in this report, but is certainly a risk that is managed and controlled within the risk and capital management framework in Nordea.

#### Risk in pillar 1

In pillar 1, which forms the base for the capital requirement, there are three risk types: credit, market and operational risk.

- Credit risk is the risk of loss if counterparts of Nordea fail to fulfil their agreed obligations and that the pledged collateral does not cover Nordea's claims. The credit risk in Nordea arises mainly from various forms of lending but also from guarantees and documentary credits, such as letters of credit. Furthermore, credit risk includes counterparty risk which is the risk that Nordea's counterpart in a foreign exchange, interest rate, commodity, equity or credit derivative contract defaults prior to maturity of the contract and Nordea at that time has a claim on the counterpart. In Nordea, quantification of credit risk was initially developed in Nordea as part of the Economic Capital framework. The measurement of credit risk is based on the parameters; PD, LGD and CCF.

- Market risk is the risk of loss in the market value of portfolios and financial instruments, also known as market price risk, as a result of movements in financial market variables. The market price risk exposure in Nordea relates primarily to interest rates and equity prices and to a lesser degree to foreign exchange rates and commodity prices. For all other activities, the basic principle is that market risk is eliminated by matching assets, liabilities and off-balance sheet items. Nordea uses a Value at Risk model (VaR model) for calculating RWA for general market risk from equities, interest rates and foreign exchange in the trading book, as well as for specific market risk from equities and interest rates for the major portfolios in the Nordic countries.
- Operational risk is defined as the risk of direct or indirect loss, or damaged reputation resulting from inadequate or failed internal processes, from people and systems, or from external events. Legal and compliance risk as well as crime risk, project risk and process risk, including IT risk, constitute the main subcategories to operational risk.

#### Risk in pillar 2

In pillar 2 other risk types are measured and assessed. Nordea manages and measures these risk types although they are not included in the calculation of the minimum capital requirements. In Nordea's calculation of internal capital (Economic Capital) most of the pillar 2 risk is included as well as risk in Nordea's life insurance operations. Examples of pillar 2 risk types are liquidity risk, business risk, interest rate risk in the non-trading book and concentration risk:

- Liquidity risk is the risk of being able to meet liquidity commitments only at increased cost or, ultimately, being unable to meet obligations as they fall due. The liquidity risk management focuses on both short-term liquidity risk and long-term structural liquidity risk. Nordea's liquidity risk management includes a business continuity plan and stress testing for liquidity management. In order to measure the exposure, a number of liquidity risk measures have been developed.
- Business risk represents the earnings volatility inherent in all business due to the uncertainty of revenues and costs due to changes in the economic and competitive environment. Business risk is calculated based on the observed volatility in historical profit and loss that is attributed to business risk.
- Interest rate risk in the non-trading book consists of exposures deriving from the balance sheet (mainly lending to public and deposits from public) and from hedging the equity capital of the Nordea Group. The interest rate risk inherent in the non-trading book is measured in several ways on a daily basis and in accordance with the financial supervisory authorities' requirements.
- The market risk in Nordea's investment portfolios includes equity, interest rate, private equity, hedge fund and foreign exchange risk and is included as market risk in Nordea's Economic Capital framework.

- Pension risk is included in market risk Economic Capital and includes equity, interest rate and foreign exchange risk in Nordea's internally defined pension plans.
- Real estate risk consists of Nordea's exposure to owned and leased properties and is included in Nordea's market risk Economic Capital.
- Concentration risk is the credit risk related to the degree of diversification in the credit portfolio, i.e. the risk inherent in doing business with large customers or not being equally exposed across industries and regions. Concentration risk is captured in Nordea's Economic Capital framework through the use of a credit risk portfolio model which considers industry, geography and single-name concentrations in the credit portfolio.

### 2.2.2 Monitoring and reporting

The control environment in Nordea is based on the principles of independence and separation of duties. Monitoring and reporting of risk is conducted on a daily basis for market and liquidity risk, on a monthly or quarterly basis for credit risk and on a quarterly basis for operational risk.

Risk reporting is regularly made to Group Executive Management and to the Board of Directors. The Board of Directors receives internal risk reporting which covers market, credit and liquidity risk per main legal entity. Within the credit risk reporting different aspects such as credit migration, current probability of default and stress testing are included.

The internal capital reporting includes all types of risk and is regularly distributed to the Risk Committee, ALCO, Capital Planning Forum, Group Executive Management and Board of Directors.

Group Internal Audit makes an independent evaluation of the processes regarding risk and capital management in line with separate auditing programs.

### 3. Regulatory capital requirements (pillar 1)

This chapter describes the regulatory capital requirements in Nordea. The risk types included are based on pillar 1 in the CRD and contain credit, market and operational risk.

In table 3, an overview of the capital requirements and the RWA as of December 2007 divided on the different risk types is presented. The credit risk comprises 92% of the risk in Nordea. Operational risk accounts for 6% of the capital requirements and market risk comprises 2% of the capital requirements. The low capital requirement for market risk is positively effected by the fact that Nordea has received approval by the Financial Supervisory Authorities to use the internal models approach for market risk.

The table also includes information about the approach used for calculation of the capital requirements. Out of the total capital requirements for credit risk, 53% have been calculated with the IRB approach, 43% with the standardised approach and 4% with the previous regulatory framework (Basel I). Nordea Bank Polska S.A., Nordea Bank S.A. (Luxembourg) and JSB Orgresbank (Russia) have in 2007 reported in accordance with the previous regulatory framework, Basel I.

Furthermore in table 3, the capital requirements for credit, market and operational risk are adjusted with EUR 2,649m due to the transition rules (known as the capital floor). In 2007, the capital requirements could not be lower than 95% of the capital requirements calculated under Basel I regulations. The corresponding floors for 2008 and 2009 are 90% and 80% respectively.

Table 3: Capital requirements and RWA, 31 December 2007

<b>Adjustment for transition rules</b>		
Additional capital requirement according to transition rules	2,649	33,103
<b>Total</b>	<b>16,367</b>	<b>204,585</b>

#### 3.1 Capital requirements for credit risk

In June 2007, Nordea received approval by the Financial Supervisory Authorities to use FIRB approach for corporate and institution portfolios in Denmark, Finland, Norway and Sweden with exceptions for foreign branches and subsidiaries. Nordea aims to gradually implement the IRB approach for the retail portfolio and other portfolios before end 2009, see figure 2. The standardised approach will continue to be used for smaller portfolios and new portfolios for which approved internal models are not yet in place.

Figure 2: Roll out plan

##### 3.1.1 Capital requirements by exposure class

In the IRB and the standardised approaches, the regulatory capital requirements for credit risk are calculated using the following formula:

$$\text{Capital requirements} = \text{RWA} * 8\%$$

where,

$$\text{RWA} = \text{risk weight} * \text{EAD}$$

In table 4, the exposure, Exposure at Default (EAD), average risk weight percentage, RWA and capital requirement, are distributed by exposure class, which serves as the basis for the reporting of capital requirements. There are seven exposure classes for the IRB approach and fifteen classes for the standardised approach. In this report the IRB exposure classes that Nordea has been approved for are presented. For the remaining portfolios the standardised approach exposure classes are used. Nordea has chosen to merge some exposure classes due to low exposures in these classes and to make the information easier to read. In table 4, sovereign exposures are split mainly into two exposure classes, central government/central banks and regional governments/local authorities. Retail exposures are split into two exposures classes, retail and exposures secured by real estates.

The definitions of exposure classes in the standardised approach differ from the classification in accordance with the IRB approach. Some exposure classes are derived from the type of counterparty while others are based on the asset type, product type, collateral type or exposure size. The exposure value of an on-balance sheet exposure in the IRB approach is measured gross of value adjustments such as provisioning. The exposure at default (EAD) for the on-

balance sheet items, derivative contracts and securities financing transactions is 100% of the original exposure. Off-balance sheet exposures are converted into EAD using credit conversion factors (CCF). For further details, see chapter 4.

The risk weight is calculated as RWA divided by EAD for IRB exposures. For exposures in the standardised approach, the risk weight is given by the Financial Supervisory Authorities.

For details of calculation of RWA, see chapter 4.3. The principles for the calculation of RWA for credit risk differ between the exposure classes.

For Basel I reporting entities, the risk weight is set in accordance with the requirements from the Financial Supervisory authorities. Due to that the definition of exposure classes were not implemented in the previous regulation, the RWA and capital requirements for Basel I reporting entities are only disclosed on total level. For further details of calculation of RWA, see chapter 3.4.

Table 4: Capital requirement for credit risk, 31 December 2007

EURm	Exposure	EAD	Average risk weight	RWA	Capital requirement
<b>IRB exposure classes</b>					
Institutions	44,328	41,591	22%	9,302	744

Basel I reporting entities	7,101			5,745	460
<b>Total</b>	<b>429,287</b>			<b>156,952</b>	<b>12,556</b>

<sup>1)</sup> Administrative bodies and non-commercial undertakings, multilateral developments banks, institutions standardised, corporate standardised, past due items, short term claims, covered bonds, and other items. Associated companies not included.

### 3.2 Capital requirements for market risk

Nordea uses its own internal Value-at-Risk (VaR) model to calculate capital requirements for large parts of the trading book, operationally defined as positions in Nordea Markets. The model covers interest rate risk, equity risk and foreign exchange risk (see chapter 5).

The VaR model is based on the empirical behaviour of market variables and takes into account the diversification effect of the various types of risk. In Nordea's opinion, the VaR model therefore gives a more accurate picture of the risk in the trading book than the fixed risk weight in the standardised approach in the CRD, which nevertheless remains the basis for calculating capital adequacy for part of the portfolio ('non-VaR' in table 5).

As seen in table 5, the largest contribution to the non-VaR capital requirement is interest rate risk and equity risk. More precisely, the non-VaR contribution is mainly related to specific interest rate risk and specific equity risk in the trading book in Nordea Bank Danmark Group.

The main part of the market risk required capital presented in table 5 is related to business in Nordea Markets. Of the EUR 3.6bn in market risk RWA, approximately EUR 3.3bn covers Nordea Markets while the other EUR 0.3bn includes equity and interest rate risk in JSB Orgresbank (Russia).

Table 5: Capital requirements for market risk, 31 December 2007

EURm	Trading book, VaR		Trading book, non-VaR		Banking book, non-VaR		Total	
	RWA	Capital requirement	RWA	Capital requirement	RWA	Capital requirement	RWA	Capital requirement
Interest rate risk	665	53	2,656	213			3,321	266
Equity risk	183	15	305	24			488	39
Foreign exchange risk	103	8			0 <sup>1)</sup>	0 <sup>1)</sup>	103	8
Commodity risk			66	5			66	5
Diversification effect	-424	-34					-424	-34
<b>Total</b>	<b>527</b>	<b>42</b>	<b>3,027</b>	<b>242</b>	<b>0</b>	<b>0</b>	<b>3,554</b>	<b>284</b>

<sup>1)</sup> FX risk in the banking book (25 EURm) is less than 2% of the capital base and therefore excluded from the market risk capital

### 3.3 Capital requirements for operational risk

The capital requirement for operational risk is in Nordea calculated according to the standardised approach, in which all of the institution's activities are divided into eight standardised business lines: corporate finance, trading & sales, retail banking, commercial banking, payment & settlement, agency services, asset management and retail brokerage.

The total capital requirement for operational risk is calculated as the sum of the capital requirements for each of the business lines for each entity. The risk for each business line is the beta coefficient multiplied by gross income. The beta coefficients differ between business lines and are in the range of 12% to 18%.

The capital requirement for operational risk amounts to EUR 878m.

### 3.4 Capital requirements for Basel I entities

Credit risk and market risk are taken into account in the RWA calculation under Basel I, while operational risk is not included as a risk type.

The calculation of credit risk RWA under Basel I is less sophisticated compared with the CRD. There are four risk categories to which the exposures are divided:

- A. Exposures to government/central banks within the OECD (risk weight of 0%)
- B. Exposures to local governments or banks/financial institutions within the OECD (risk weight of 20%)
- C. Exposures secured by mortgages on residential property (risk weight of 50%)
- D. Other exposures (risk weight of 100%)

For market risk there are no material changes as internal models have been implemented earlier in the CRD.

## 4. Credit risk (pillar 1)

In this chapter, the credit risk and its components are described with respect to:

- The exposure classes used in the calculations of RWA and capital requirement are defined and explained.
- The information about exposures is disclosed and presented from several aspects, split by exposure classes, geography and industry.
- The approaches and methods used in the RWA calculations are presented including information about credit risk mitigation and Nordea's internal rating system.
- The information about impaired loans and loan losses is disclosed.

### 4.1 Exposure classes

Nordea has a diversified credit portfolio, which can be divided into the exposure classes defined by the CRD. The basis for calculation of the EAD in the RWA formula is the division of exposure classes. Nordea has received approval to use the FIRB approach for the exposure classes: institution, corporate and other non-credit obligation assets. For the remaining exposure classes Nordea used the standardised approach in 2007.

#### 4.1.1 FIRB exposure classes

##### *Institutions exposures*

Exposures to credit institutions and investment firms are classified as exposures to institutions. In addition, exposures to regional governments, local authorities and multilateral development banks are classified as exposures to institutions if they are not treated as exposures to sovereigns<sup>1)</sup> according to regulations issued by the authorities.

##### *Corporate exposures*

Exposures that are not assigned to any of the other exposure classes are classified as corporate exposures. The corporate exposure class contains exposures that are rated in accordance to Nordea's internal guidelines.

##### *Other non credit-obligation assets*

Assets that do not require any performance from any counterparty are classified as non-credit obligation assets.

#### 4.1.2 Standardised exposure classes

##### *Central governments and central banks*

Exposures to central governments and central banks are, subject to national discretion, treated with low risk if the counterparty is within European Economic Area (EEA) member states.

##### *Regional governments and local authorities*

Exposures to regional governments and local authorities are included in this exposure class.

##### *Retail exposures*

Exposures to small and medium sized entities and to private individuals are included in the retail exposure class and defined in accordance to Nordea's internal guidelines.

##### *Exposures secured by real estate*

Exposures that are secured by mortgages on residential or commercial real estate are included in this exposure class. National options exist for commercial real estates, which result in the risk weight differing between the Nordic countries.

##### *Other*

- Exposures to administrative bodies and non-commercial undertakings, multilateral development banks, international organisations, institutions and corporate.
- Past due items. Items that are past due for more than 90 days.
- Short-term claims. Short-term exposures to institutions and corporate for which a short-term credit assessment by a nominated rating agency is available, are assigned a risk weight in accordance with a six step mapping scale made by the Financial Supervisory Authorities.
- Other items:
  1. Tangible assets, prepayments and accrued income where no counterpart can be determined, holding of equity etc
  2. Cash and gold
  3. Asset sale, repurchase agreements and outright forward purchases

##### *Securitisations*

Nordea has not securitised assets from its ordinary lending portfolio (banking book). For details about securitisation activities in Nordea, see chapter 7.

### 4.2 Information about exposure

The credit risk exposure presented in this report differs in some areas from the credit risk exposure in Nordea's financial reporting in the annual report.

The credit risk exposure in the pillar 3 reporting is distributed by exposure class, where each exposure class is distributed into the following different exposure types:

- On-balance sheet items
- Off-balance sheet items (e.g. guarantees and unutilised amounts of credit facilities)
- Securities financing (e.g. reversed repurchase agreements)
- Derivative contracts

In Nordea's external financial reporting in the annual report, the credit risk exposure includes:

- On-balance sheet items: loans and receivables to credit institutions and loans and receivables to the public (e.g. reversed repurchase agreements)
- Off-balance sheet items (e.g. guarantees and unutilised amounts of credit facilities)
- Counterparty risk in derivative contracts
- Credit risk in treasury bills and interest-bearing securities

<sup>1)</sup> Sovereigns include central governments, central banks, regional governments, local authorities and other public sector entities.

The main differences and the effect on comparisons between the exposures are:

- The exposure distributions by industry and by geography are in the pillar 3 reporting presented for the entire credit exposure, whereas in the financial reporting, these distributions are presented for loans and receivables to the public (lending), being the main part of the on-balance sheet exposure.
- Treasury bills and interest-bearing securities are in the pillar 3 reporting partly included in the RWAs for market risk, whereas in the financial reporting, these are included in the credit risk exposure.
- Reversed repurchase agreements are in the pillar 3 reporting included as a separate exposure type, whereas in the financial reporting, these are included in the on-balance sheet item loans and receivables to the public (corporate/institutions).
- Loans and receivables to the public (corporate) in the financial reporting consist of the on-balance sheet exposure in both the Corporate exposure class and a smaller part of the Retail exposure class (non-rated SMEs) in the pillar 3 reporting.
- Equity holdings related to insurance operations are included in the annual report, but not in the pillar 3 reporting since the insurance operations are deducted from the capital base.
- Intangible assets and deferred taxes are deducted from the capital base and therefore not included in the RWA calculations. In the financial reporting these items are included in the balance sheet.

In table 6, the link between the balance sheet and the capital adequacy is presented, as regards to on-balance items. It can be concluded that the on balance sheet exposure in the pillar 3 reporting consist mainly of loans and receivables but also interest bearing securities in the banking book.

Table 6: Link between balance sheet and Capital Adequacy

Loans and receivables to credit institutions	14,270
Loans and receivables to the public	231,165

of which interest-bearing securities	7,706
of which other	10,592
<b>Derivatives</b>	<b>31,393</b>
<b>Basel 1 entities</b>	<b>7,102</b>
<b>Life insurance operations<sup>1)</sup></b>	<b>33,733</b>
<b>Other<sup>2)</sup></b>	<b>2,445</b>
<b>Total assets balance sheet</b>	<b>389,054</b>

<sup>1)</sup> Intragroup exposures in the Life operations are treated as external from a credit risk perspective

<sup>2)</sup> Other includes adjustments of provisions, deferred taxes, intangible assets and investments in associated undertakings

#### 4.2.1 Information about exposure type by exposure class

In table 7, the exposures are split by exposure classes and exposure types as of December 2007. The table is split between exposure classes subject to the FIRB approach and exposure classes subject to the standardised approach. The main part of the exposure is within the exposure classes corporate, retail and exposures secured by real estate. Approximately 39% of the exposure class institutions relate to counterparty credit risk exposures stemming from derivatives. The exposure class corporate has a large portion of off-balance sheet exposures which comprises 46% of the total exposure, but the effect on RWA for these is reduced due to use of CCF in the RWA calculation (the average CCF for these exposures is 35%). In the retail exposure class, 34% of the exposures relate to off-balance sheet exposures. The average CCF for these exposures is 6%, due to that the majority of the exposures are unconditionally cancellable and thereby has a CCF of 0%.

Table 7: Exposure classes split by exposure type, 31 December 2007

EURm	On-balance sheet items	Off-balance sheet items	Securities financing	Derivatives	Total exposure
<b>IRB exposure classes</b>					
Institutions	21,393	5,153	600	17,182	44,328
Corporate	101,979	91,569	313	3,939	197,800
Other non-credit obligation assets	1,186	0	0	0	1,186
<b>Total IRB approach</b>	<b>124,558</b>	<b>96,722</b>	<b>913</b>	<b>21,121</b>	<b>243,314</b>
<b>Standardised exposure classes</b>					
Central governments and central banks	14,812	2,404	12	442	17,670
Regional governments and local authorities	3,773	5,196	0	144	9,113
Retail	25,426	12,972	0	34	38,432
Exposures secured by real estates	86,104	1,576	0	0	87,680
Other <sup>1)</sup>	16,072	9,067	15	823	25,977
<b>Total standardised approach</b>	<b>146,187</b>	<b>31,215</b>	<b>27</b>	<b>1,443</b>	<b>178,872</b>

<sup>1)</sup> Administrative bodies and non-commercial undertakings, multilateral developments banks, institutions standardised, corporate standardised, past due items, short-term claims, covered bonds, and other items

In table 8, the exposures are presented as an average during the previous time period. In comparison to table 7, the average exposure during 2007 is lower than the exposure at year end 2007. The main increase is in the IRB exposure classes, corporate and institutions, which have gradually increased during the year.

#### 4.2.2 Information about exposure by geography (per exposure class)

In table 9, the exposures are split by main geographical areas and exposure classes based on where the credit risk is referable. The main markets for Nordea are the Nordic countries, as well as Lithuania, Latvia, Estonia, Poland, Luxembourg and Russia.

The relatively large exposure amount in the exposure class institutions in Finland is explained by that the main part of the counterparty credit risk derivative exposures is referable to Finland. The corporate exposure is fairly well distributed over the four main Nordic countries.

In Denmark and Finland, Nordea has a relatively larger market share of consumer lending than in comparison to Sweden and Norway.

Table 8: Exposure classes split by exposure type, Average exposure<sup>2)</sup> during 2007

EURm	On-balance sheet items	Off-balance sheet items	Securities financing	Derivatives	Total exposure
<b>IRB exposure classes</b>					
Institutions	19,123	4,626	581	17,582	41,912

<sup>1)</sup> Administrative bodies and non-commercial undertakings, multilateral developments banks, institutions standardised, corporate standardised, past due items, short term claims, covered bonds, and other items. From F IRB other non-credit obligation assets.

#### 4.2.3 Information about exposure by industry

In table 10, the exposures are split by Nordea's important industry groups, based on NACE codes, for the corporate exposure class. The main exposures in the corporate portfolio relate to industrial commercial services and real estate management and investment. Industrial commercial services include industrial conglomerates which could include both services and manufacturing activities. The two largest industry groups comprise 37.5% of the total exposure in the portfolio.

Table 10: Corporate exposure split by industry group, 31 December 2007

EURm	Exposure
Construction and engineering	4,537
Consumer durables (cars, appliances etc)	3,288
Consumer staples (food, agriculture etc)	14,444
Energy (oil, gas etc)	1,405
Health care and pharmaceuticals	1,782
Industrial capital goods	7,726
Industrial commercial services	32,033
IT software, hardware and services	1,059
Media and leisure	3,268
Metals and mining materials	717

Other materials (chemical, building materials etc)	6,182
Other, public and organisations	12,237
Other	16,164
<b>Total exposure</b>	<b>197,800</b>

#### 4.2.4 Information about exposure by maturity

For exposures calculated with the FIRB approach, the maturity (M) is set to standard values in the RWA calculation formula based on the estimates set by the financial supervisory authorities. The maturity parameter is set to 2.5 years for the exposure types on balance, off balance and derivatives. For the exposure type securities financing the maturity parameter is 0.5 years.

In table 11, the exposure is divided by maturity, which is defined as the contractual maturity. The exposure is divided between the exposure classes institutions and corporate. Nordea's exposure to institutions is mainly within the short maturity below 1 year. The corporate exposure below 1 year equals 41% of the total corporate exposure, and the majority is related to on-balance exposure. The exposure over 1 year is equally divided between maturities 1-5 years and over 5 years.

Table 11: Exposure split by maturity, 31 December 2007

EURm	Institutions	Corporate
< 1 year	28,627	80,151
1-5 years	9,388	58,554
> 5 years	6,313	59,095
<b>Total exposure</b>	<b>44,328</b>	<b>197,800</b>

#### 4.2.5 Information about equity holdings

In the exposure class Other items, Nordea's equity holdings outside the trading book are included.

In table 12, the exposure of Nordea's equity holdings outside the trading book are shown in groups based on the intention of the holding. In the investment portfolio, holdings in private equity funds are included with EUR 154m. Book value equals fair value for all the equities shown in the table. The evidence of published price quotations in an active market is the best evidence of fair value and when they exist they are used to measure financial assets and financial liabilities. Nordea predominantly uses published quotations to establish fair value for shares.

Table 12: Equity holding outside trading book, 31 December 2007

EURm	Book value	Fair value	Fair value of listed shares	Quoted share value	Unrealized gains loss	Realized gains/losses period YTD	Capital requirement

<b>Total</b>	<b>717</b>	<b>717</b>	<b>456</b>	<b>456</b>	<b>179</b>	<b>9</b>	<b>57</b>

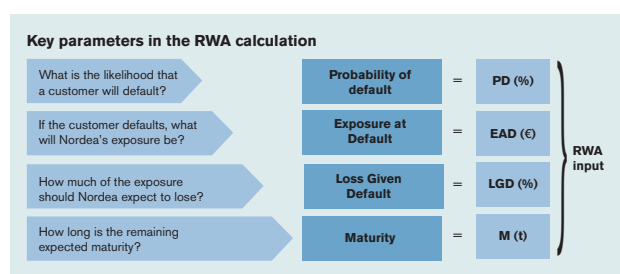

### 4.3 Calculation of RWA

The RWA calculations in Nordea differ between the exposure classes depending on the approach Nordea uses. Nordea is an IRB institution, meaning that it has received approval to calculate the credit risk by using the IRB approach. However, during the roll-out time the standardised approach are used not only for the sovereign and retail portfolios but also for some other portfolios. The following section describes the principles for calculating RWA with the FIRB and the standardised approach respectively.

#### 4.3.1 Calculation of RWA with the FIRB approach

The FIRB approach measures credit risk using sophisticated formulas with internal input of Probability of Defaults (PD) and inputs fixed by Financial Supervisory Authorities for Loss Given Default (LGD), Exposure at Default (EAD) and Maturity (M). The parameters are illustrated in figure 3:

Figure 3: Key parameters in the RWA calculation

In the following section, the parameter PD and the rating system, which is closely linked to the estimation of PD, are described in more detail.

#### Rating system

The internal rating system comprises all of the methods, models, processes, controls, data collection and IT systems that support the assignment of ratings to corporate customers, bank counterparts as well as sovereigns<sup>1)</sup>, and the quantification of the PD estimates. The control environment in Nordea is based on the principles of separation of duties and independence. The control mechanism for models and methods are applied both to estimation and valida-

tion activities. Procedures are documented and regularly reviewed. Group Internal Audit reviews the validation yearly.

The rating system is used as an integrated part of the risk management and decision-making process in Nordea and is therefore used for more purposes than calculating RWA. The ratings, for instance, and the associated PDs are central in:

- the credit approval process
- calculation of Economic Capital and Expected Loss (EL)
- monitoring and reporting of credit risk
- performance measurement using the economic profit framework

A rating is an estimate that exclusively reflects the quantification of the repayment capacity of the customer, i.e. the risk of customer default. The rating scale in Nordea consists of 18 grades from 6+ to 1- for non-defaulted customers and 3 grades from 0+ to 0- for defaulted customers. Grades 2+ to 1- are considered as weak, and require special attention.

The repayment capacity of each grade is quantified by the one-year PD. For each grade, the long-term average actual default frequency (ADF), which is defined as the number of customers that defaulted during a defined period divided by the number of customers that could have defaulted during the same period, is used for the assignment of PD. The default definition used for the estimation of PD is in accordance with the CRD definition. The PDs should reflect the long term average ADF, but since the number of years of available internal data still is limited, a margin is added. This margin adjusts for that the available time series is captured during a benign economic cycle and that the number of observations are limited.

In table 13, the exposure is distributed on a condensed rating scale, where the 18 rating grades are grouped three by three and condensed to 6 grades. The PD and the average risk weight are exposure weighted. The risk weight is a function of PD and the lower the PD the lower the risk weight. In the table 13, the average risk weight is weighted by EAD. Approximately 97% of the institution exposures and 76% of the corporate exposures are in the three highest rating grades. Exposures categorised as being in default and non-obligation assets are not included in the figures in the table.

Table 13: Exposure split by rating grade, 31 December 2007

Rating	Institutions			Corporate		
	Average PD	Exposure	Average risk weight	Average PD	Exposure	Average risk weight
6	0.04%	32,569	16%	0.04%	15,473	16%
5	0.09%	8,843	29%	0.11%	51,125	30%
4	0.35%	1,484	60%	0.34%	83,674	53%
3	1.33%	669	105%	1.28%	41,041	89%
2	5.08%	406	155%	5.00%	2,959	126%
1	14.76%	39	230%	16.04%	362	189%

<sup>1)</sup> Sovereigns include central governments, central banks, regional governments, local authorities and other public sector entities.

Ratings are normally assigned in conjunction with credit proposals or at the annual review of the customers, and approved by the credit committees. The consistency and transparency of the ratings are ensured by the use of rating models. A rating model is a set of specified and distinct rating criteria, which given a set of a customers characteristics produces a rating. It is based on the possibility to predict the future performance of customers on the basis of their characteristics.

Nordea has decided upon a differentiation of rating models in order to better reflect the risk involved for customers with different characteristics. Hence, rating models have been developed for a number of general as well as specific segments e.g. real estate management and shipping. Different methods ranging from purely statistical to expert-based, depending of the segment in question, have been used when developing the rating models. The models are in general based on an overall framework, in which financial and quantitative factors are combined with qualitative factors. Examples of financial factors are profitability measures such as return on capital employed and debt service measures such as debt to earnings before interest, taxes, depreciations and amortisations (EBITDA). Examples of qualitative factors to be assessed in the rating process are management and strategy.

#### Estimation and validation

Nordea has established an internal validation process in accordance with the CRD requirements with the purpose of ensuring and improving the performance of Nordea's models, procedures and systems and to ensure the accuracy of the PD estimates.

The rating models are validated annually and the validation includes both a quantitative and a qualitative validation. The quantitative validation includes statistical tests of the rating models' discriminatory power, i.e. the ability to distinguish default risk on a relative basis, and cardinal accuracy, i.e. the ability to predict the level of defaults.

The PDs are validated semi-annually and tested with respect to their ability over time to predict the ADFs. For example, the tests are performed to ensure:

- sufficient differentiation between strong and weak customers
- over time not significantly lower or higher average ADF than the corresponding PD
- sufficient margin between PD and ADF, which is expected to decrease over time

The validation performed in 2007 shows that the rating models as well as PDs are fulfilling the overall requirements. Some smaller adjustments have been proposed following the annual process for updates of models and parameters and will be implemented in 2008.

#### Comparison of Expected Loss and actual net loss

In table 14 the Expected Loss (EL) is compared to the actual net losses. The EL has been calculated using the definition from the Economic Capital framework, in which defaulted exposures receive 0% EL. The EL is calculated as the average of the end of quarter figures in 2007. The net loss is the full year 2007 outcome. Further, the customer segments are not perfectly matching the exposure classes used in the RWA calculations, but that has no significant impact on the figures.

Note that the EL will vary over time as a consequence of that the rating and the security coverage distributions

migrate with the business cycle. This manifests that Nordea's rating models are neither perfectly through the cycle nor perfectly point in time. The implications are that the EL calculated at the top of the business cycle not will represent the EL over a full business cycle and that migrations will not explain the full variation in actual losses. It is expected that the average long term net loss will match the average EL over time. The figures for 2007 evidence that the net losses are significantly lower than what should be expected on average due to the strong credit cycle. The fact that net losses is negative is due to the reversals and recoveries from previous years, which limits the use of this figure as an indicator of the model's performance looking at only one year of data. However, when including a long time series, e.g. the last five years, a similar conclusion can be drawn. More important is that Nordea has received approval for using the internal rating models for corporate and institutions by showing compliance with the minimum requirements, among others showing that there is a sufficient margin between the PDs and the ADFs.

In 2007, small changes were seen in terms of both new provisions and recoveries for individually assessed loans. For collectively assessed loans, a decrease has been made in the global transfer risk reserve and an increase of provisions for specific groups of loans, e.g. leveraged finance as well as exposure in the Baltic countries.

Table 14: Net loss and Expected loss by customer segment, 31 December 2007

EURm	Net loss	EL
Household	28	110
Corporate	-88	270
Public sector	0	0
<b>Total</b>	<b>-60</b>	<b>381</b>

#### Relation between internal and external ratings

The table 15 shows the mapping from the internal rating scale to the Standard & Poor's rating scale, using condensed scales.

Table 15: Indicative mapping between internal rating and Standard & Poor's

Rating	
Internal	Standard & Poor's

The mapping of the internal ratings to the Standard & Poor's rating scale is based on an assessment using a pre-defined set of criteria, such as comparison of default and risk definition, developed during the application to use the FIRB approach. The mapping does not intend to reflect that there is a fixed relationship between Nordea's internal rating grades and Standard & Poor's rating grades since the rating approaches differ. On a customer level the mapping does not always hold and, moreover, the mapping may change over time.

### 4.3.2 Calculation of RWA with the standardised approach

The standardised approach measures credit risk pursuant to fixed risk weight and is the least sophisticated capital calculations. The application of risk weight in standardised approach is given by Financial Supervisory Authorities and is based on the exposure class to which the exposure is assigned. In calculating RWA with the standardised approach external rating may be used as an alternative to use the fixed risk weight. The external ratings must come from eligible external rating agencies.

#### *Central government and central banks*

Subject to national discretion, the risk weight of 0% is, for the majority of these exposures, applied in Nordea.

Nordea uses Standard & Poor's as eligible rating agency. The external rating is converted to the credit quality step (the mapping is defined by the Financial Supervisory Authorities), which corresponds to a fixed risk weight. In table 16, the central government and central banks exposures distributed by the credit quality steps is available. The exposure in the table is after credit risk mitigation, but the effect of credit risk mitigation is minor. It can be concluded that the main part of the exposure towards central governments and central banks is within the highest credit quality step, which results in no RWA for these exposures.

Table 16: Exposures to central governments and central banks, 31 December 2007

EURm Standard & Poor's rating	Credit quality step	Risk weight	Exposure
AAA to AA–	1	0%	17 022
A+ to A–	2	20%	446
BBB+ to BBB–	3	50%	10
BB+ and below, or without rating	4 to 6 or blank	100–150%	192
<b>Total</b>			<b>17 670</b>

#### *Regional governments and local authorities*

Exposures to regional governments and local authorities are treated as exposures to the central government in whose jurisdiction they are established, with the exception of Norway, where a risk weight of 20% is applied.

#### *Retail exposures*

Retail exposures are assigned a risk weight of 75%.

#### *Exposures secured by real estate*

Exposures secured by mortgages on residential real estate are assigned a risk weight of 35%. The risk weight is only reduced for the part of the exposure that is fully secured. Exposures that are secured by commercial real estate are subject to national discretions and the regulations differ between the Nordic countries.

#### *Other*

- Exposures to administrative bodies and non-commercial undertakings (such as public sector entities) are, subject to decision by the local authority, assigned a risk weight of 0% to 100%.
- Exposures to named multilateral development banks are assigned a risk weight of 0%. Other multilateral development banks are assigned a risk weight according to the methods used for exposures to institutions.
- Exposures to named international organisations are assigned a risk weight of 0%. Other international organisations are assigned a risk weight of 100%.
- Exposures to institutions are assigned a risk weight depending on the external rating, by an eligible rating agency, of the central government in the jurisdiction of the institution. In Poland, the risk weight of the exposure is determined according to the external rating of the institution. Specific rules also determine how to treat an exposure where no rating by an eligible rating agency exists. Therefore, the risk weights can differ from 0% to 150% for these exposures.
- Exposures to corporate rated by eligible rating agency are assigned a risk weight from 20% to 150%. Exposures without external rating are assigned a risk weight of 100%.
- Past due items. The unsecured part of any past due item are assigned a risk weight of 150% if value adjustments (allowances) are less than 20% and 100% if value adjustments (allowances) are no less than 20% of the unsecured part. The part of the past due items that are secured by residential real estate property are assigned a risk weight of 100% or 50% depending on the size of the value adjustment (above or below 20%) and national regulations.
- Short-term claims. Exposures reported as short-term claims receive a risk weight based on the short-term external rating of the institution.
- Other items
  1. Tangible assets and holdings of equity are assigned a risk weight of 100%.
  2. Cash are assigned a 0% risk weight.

### 4.3.3 Credit risk mitigation

RWA, expected loss and exposures are reduced by the recognition of credit risk mitigation techniques. Only certain types of collateral and some issuers of guarantees are eligible for capital requirement purposes. Furthermore the collateral management process and the terms in the collateral agreements have to fulfil the minimum requirements (such as procedures for monitoring of market values, insurance and legal certainty) in the capital adequacy regulations. Collateral items and guarantees which can be used in the credit risk mitigation in the capital requirement are called eligible collateral.

The reduction of the capital requirements is calculated in three ways, depending of the type of credit risk mitigation technique:

1. Adjusted exposure amount. Nordea uses the comprehensive method for financial collateral such as cash, bonds and stocks. The exposure amount is adjusted with regards to the financial collateral. The size of the adjustment depends on the volatility of the collateral and the exposure. Nordea uses volatility adjustments specified by the Financial Supervisory Authorities (supervisory haircuts).
2. Adjusted PD (substitution of PD). The substitution method is used for guarantees, which implies that the PD is substituted. This means that the credit risk in respect of the customer is substituted by the credit risk of the guarantor and the risk is thereby reduced. Hence, an exposure fully guaranteed will be assigned the same capital requirement as if the loan was initially granted to the guarantor rather than the customer. The PD value of exposures is adjusted if the capital requirement for both the customer and the guarantor is calculated according to the IRB approach.
3. Adjusted LGD. The LGD value is reduced for the part of the exposures in the IRB approach (i.e. to large corporate and institutions) that is fully collateralised with real estates (commercial and residential), other physical collateral or receivables. The size of the LGD adjustment is stipulated by the CRD in the FIRB approach.

#### *Description of the main types of risk mitigation in Nordea*

Nordea uses a wide variety of risk mitigation techniques in several different markets which contribute to risk diversification and credit protection. The different credit risk mitigation techniques such as collateral, guarantees, netting agreements and covenants are used to reduce the credit risk. All credit mitigation activities are not recognised for capital adequacy purposes since they are not defined as eligible as credit risk mitigation, i.e. covenants. Loan documentations and similar agreements can include covenants such as financial ratios that the debtor has to comply with. Covenants are not taken into account in the calculations of regulatory capital. Another example is receivables. Receivables with an original maturity of more than one year are not eligible for credit risk mitigation in the capital adequacy reporting. A third example is assets that could not be sold in a liquid market. Such assets could be pledged but are not assigned any value in Nordea's credit process, nor in the regulatory capital calculations.

In table 17, the exposure per exposure class secured by eligible collateral, guarantees and credit derivatives are available. The table presents a split between exposure classes subject to the FIRB approach and exposure classes subject to the standardised approach. Currently, 18% of the

corporate exposures are secured by collateral, but this is expected to increase in accordance with Nordea's implementation plan.

*Table 17: Exposure secured by collaterals, guarantees and credit derivatives, 31 December 2007*

EURm	Exposure	of which secured by guarantees and credit derivatives	of which secured by collateral
<b>IRB exposure classes</b>			
Institutions	44,328	139	2,569
Corporate	197,800	4,971	37,761
Other non-credit obligation assets	1,186	0	0
<b>Total IRB approach</b>	<b>243,314</b>	<b>5,111</b>	<b>40,330</b>
<b>Standardised exposure classes</b>			
Central government and central banks	17,670	27	0
Regional governments and local authorities	9,113	0	0

Exposures secured by real estates	87,680	0	87,680
Other <sup>1)</sup>	25,977	2	2
<b>Total standardised approach</b>	<b>178,872</b>	<b>963</b>	<b>87,727</b>

<sup>1)</sup> Administrative bodies and non-commercial undertakings, multilateral development banks, institutions standardised, corporate standardised, past due items, short term claims, covered bonds, and other items

#### *Guarantees and credit derivatives*

The guarantees used as credit risk mitigation in Nordea are largely issued by central and regional governments in the Nordic countries. Banks and insurance companies are also important guarantors of credit risk.

Only eligible providers of guarantees and credit derivatives can be recognised in the standardised and FIRB approach for credit risk. All central governments, regional governments and institutions are eligible. Some multinational development banks and international organisations are also eligible. Guarantees issued by corporate entities can only be taken into account if their rating corresponds to A- (Standard & Poor's rating scale) or better. Out of the main guarantors, central governments and municipalities within the Nordic countries comprise approximately 85%. The exposures that are guaranteed by these guarantors receive a 0% risk weight, with exception of municipalities in Norway which can receive a risk weight up to 20%. Approximately 12% of the main guarantors are institutions, where 98% of these exposures have a guarantor with a rating of 5 or higher. The remaining guarantors are corporate.

Nordea uses credit derivatives as credit risk protection only to a very limited extent since Nordea considers the credit portfolio to be well diversified.

#### *Collateral*

The use of collateral for credit risk mitigation and valuation of collateral is based on Nordea's credit policy and strategy as well as credit instructions. Furthermore, local instructions ensure that national legislation and practice are taken into account.

In general, lending is based on the customer's repayment capacity and not the collateral value. The policy in

Nordea is to seek the best possible collateral position through pledge/mortgage on assets and other types of support. However, collateral is considered the secondary alternative if the repayment capacity proves inadequate.

Real estate is commonly used as collateral for credit risk mitigation purposes. There is no major concentration of real estate collateral to any region within the Nordic and Baltic countries. Other physical collateral consist mainly of ships. In table 18, the distribution of items of collateral used in the capital adequacy calculation process is available. The distribution shows that real estate is the major part of the eligible collateral items. Nordea will continue to include more collateral in accordance with the implementation plan, e.g. increase the sourcing of eligible collateral items. This will in turn have impact on the relative distribution.

Table 18: Collateral concentration, 31 December 2007

Other Physical Collateral	4.5%
Receivables	2.2%
Residential Real Estate	75.7%
Commercial Real Estate	15.1%
Financial Collateral	2.5%

#### Valuation principles of collateral

The valuation principle for collateral is regarded as a conservative approach taken long-term market value and volatility into account when defining the maximum collateral ratio.

Valuation and hence eligibility is based on the following principles:

- Market value is assessed; markets must be liquid, public prices must be available and the collateral is expected to be liquidated within a reasonable time-frame.
- A reduction of the collateral value is to be considered if the type, location or character (such as deterioration and obsolescence) of the asset indicates uncertainty regarding the sustainability of the market value. Assessment of the collateral value also reflects the experienced volatility of market values in the past.
- Forced sale principle; assessment of market value or the collateral value must reflect that realisation of a collateral in a distressed situation is initiated by Nordea.
- No collateral value is to be assigned if a pledge is not legally enforceable and/or if the underlying asset is not adequately insured against damage.

#### Collateral policy and documentation

Local instructions emphasise that national practice and routines are timely and prudent in order to ensure that collateral items are controlled by Nordea and that the loan and pledge agreement as well as the collateral is legally enforceable. Thus Nordea holds the right to liquidate collateral in event of the obligor's financial distress and Nordea can claim and control cash proceeds from a liquidation process.

Nordea uses to a large extent national standard loan and pledge agreements, ensuring legal enforceability

#### Types of collateral commonly accepted by Nordea

Internal instructions include both general instructions such as presented above and more detailed instructions for the collateral types accepted the most:

- Residential Real Estate, Commercial Real Estate and Land. Acceptance focuses on Nordea's core markets.
- Machinery and Equipment, Vehicles, Vessels, Aircrafts and Trains
- Inventory, Receivables (trade debtors) and assets pledged under floating charge
- Financial collateral; listed shares, listed bonds and other specific securities accepted
- Deposits
- Guarantees and Letters of Support
- Insurance Policies (Capital assurance with surrender value)

For each type, more specific instructions are added to the general valuation principle. A specific maximum collateral ratio is thus assessed for each type. Restrictions for acceptance refer in general to assessment of the collateral value rather than the use of the collateral for credit risk mitigation as such.

#### The credit decision process and handling of collateral

In the process of approving credits, collateral are taking into account, including cases when the collateral is not eligible for credit risk mitigation in the capital adequacy reporting.

Nordea monitors the credit risk in a more detailed process for annual reviews of commitment, risk and collateral used for credit risk mitigation. Furthermore, for special mentioned and risk classified customers, a more detailed review takes place to ensure valuation and legal enforceability and concerning Nordea's business and credit strategies towards the customer or customer group.

#### 4.4 Information about impaired loans and loan losses

The responsibility for credit risk lies with the customer responsible unit, which on an ongoing basis assesses the customers' ability to fulfil their obligations and identifies deviations from agreed conditions and potential weaknesses in customer's performance.

Based on past due reports with late payments, the customer responsible unit must also assess whether it is an indication of that the customer's repayment ability is threatened.

If it is considered unlikely that the customer will be able to repay its debt obligations (principal, interest or fees) in full, and the situation cannot be satisfactorily remedied, the exposure is regarded as default. Exposures that have been past due more than 90 days are automatically regarded as in default, and reported as impaired and non-performing.

If credit weakness is identified in relation to a customer exposure, such exposure is assigned special attention in terms of review of the risk. In addition to continuous monitoring, an action plan is established outlining how to minimise a potential credit loss. If necessary, a special team is set up to support the customer responsible unit.

In the process to identify indication of impairment, Nordea pursues a continuous process to review the financial status of the credit exposures. Weak and impaired exposures are closely and continuously monitored and reviewed at least on a quarterly basis in terms of current performance, business outlook, future debt service capacity and the possible need for provisions.

An exposure is impaired, and a provision is recognised, if there is objective evidence, based on loss events or observable data, that there is impact on the customer's future cash flow to the extent that full repayment is unlikely, collateral included. The size of the provision is equal to the estimated loss considering the discounted value of the future cash flow and the value of pledged collateral. Impaired exposures can be either performing or non-performing. Impaired exposures are treated as in default when determining default probability.

In addition to individual impairment testing of all individually significant customers, collective impairment testing must be performed for groups of customers not considered found to be impaired on individual level.

The rationale for this two-step procedure with both individual and collective assessment is to ensure that all incurred losses are accounted for up to and including each balance sheet day. Impairment losses recognised for group of loans represent an interim step pending the identification of impairment losses for an individual customer.

#### 4.4.1 Disclosure of exposures, impaired loans and loan losses

In the tables impaired loans, loan losses and allowances are distributed and stated according to IFRS as in the annual report. The tables in this section follow the segmentation used in the annual report.

In table 19, impaired loans to corporate customers are distributed by industry.

*Table 19: Impaired loans split by industry for corporate, 31 December 2007*

EURm	Impaired loans Gross	of which non- performing
Real estate management	86	35
Construction	47	22
Agriculture and fishing	29	11
Transport	61	19
Shipping	1	1
Trade and services	181	53
Manufacturing	354	104
Financial operations	41	16
Renting, consulting and other company services	131	41
Other	19	12
<b>Total</b>	<b>950</b>	<b>314</b>

In table 20, impaired loans are distributed by geography. Out of total impaired loans of EUR 1,313m, EUR 950m is related to the corporate portfolio.

*Table 20: Impaired loans split by geography to the public<sup>1)</sup>, 31 December 2007*

EURm	Impaired loans Gross	of which non- performing
Nordic countries	1,242	432
of which Denmark	328	101

<b>Closing balance, 31 Dec 2007</b>	<b>-603</b>	<b>-354</b>	<b>-957</b>

## 5. Market risk (pillar 1)

In this chapter, the methods used for measurement of market risk are described. Nordea uses both the internal models approach and the standardised approach to capture the market risk capital requirement in the trading books. Market risk in the CRD context contains two types of risk measures: general risk and specific risk. General risk is risk related to changes in the overall market prices while specific risk is related to price changes for the specific issuer.

### 5.1 Internal model (VaR)

Nordea uses its own internal Value-at-Risk-model (VaR-model) to calculate capital requirements for the trading book, operationally defined as positions owned by Nordea Markets, for:

- Interest rate risk (general and specific risk) in Nordea Group, Nordea Bank Finland Group and Nordea Bank Norge Group
- Interest rate risk (general risk only) in Nordea Bank Danmark Group
- Equity risk (linear positions only, general and specific risk) in Nordea Group and Nordea Bank Finland Group
- Equity risk (linear positions only, general risk only) in Nordea Bank Norge Group and Nordea Bank Danmark Group
- Foreign exchange risk (general risk) in Nordea Group, Nordea Bank Finland Group, Nordea Bank Norge Group and Nordea Bank Danmark Group

General interest risk is measured by the Interest Rate VaR and specific interest rate risk is measured through Credit Spread VaR.

#### 5.1.1 The model

Nordea's universal VaR model is a 10-day, 99% confidentiality model, which uses the expected shortfall approach (sometimes referred to as tVaR, for tail-VaR) and is based on historical simulation. The "square root of ten" rule is applied to scale 1-day VaR figures to 10-day figures. The model is identical to the one used internally in the organisation to limit and measure market risk at all levels.

#### 5.1.2 Back testing

Back testing is conducted daily in accordance with the guidelines given by the Basel Committee on Banking Supervision.

For interest rate risk, separate tests of general and specific risk are carried out. For the trading books of the four legal entities, hypothetical (simulated) profit/loss (p/l) is used in the test for capture of general risk, while at global trading book level 1-day VaR is held against both hypothetical and actual p/l. In the test for capture of specific risk, 1-day VaR is also held against both actual and hypothetical p/l for the global credit trading desk.

For equity risk, a joint test of general and specific risk is conducted. For the trading books of the four legal entities, hypothetical p/l is used, while at global trading book level, 1-day VaR is held against both hypothetical and actual p/l.

Total 1-day VaR (comprising all risk categories) is also held against both hypothetical and actual p/l.

### 5.2 Standardised approach

As described above not all positions are covered by the approved VaR model, instead these have to be calculated following the standardised approach. Capital requirement for these positions is calculated according to the CRD.

The main part of the standardised approach contribution to market risk required capital is specific interest rate risk. In Nordea specific interest rate risk is measured through VaR for the trading book in Nordea Bank Finland Group and through the standardised approach for other positions. The main proportion of specific interest rate risk calculated according to the CRD derives from Nordea Bank Danmark Group. In the standardised approach specific interest rate risk is calculated through a maturity based method with different risk capital charge factors depending on category and time to maturity. Specific interest rate risk in the trading book in Nordea Bank Norge Group is calculated through the internal model approach from January 2008.

The current approved equity risk VaR model does not capture non-linear equity risk, instead the standardised approach is used for such positions. In the standardised approach equity positions receives a capital charge factor depending on the position's quality and liquidity.

Commodity risk in the trading book and FX risk outside the trading book is not covered by the VaR model and is also calculated through the standardised approach.

All trading book related activities in JSB Orgresbank is quantified through the standardised approach, which comprises both general and specific interest rate risk and equity risk as well as FX risk.

### 5.3 Stress tests

Stress tests are conducted daily for the global trading book, and for the four subgroups (for the subgroups, however, the portfolios contain both trading and banking books). The main types of stress tests include:

1. Historical stress tests, which include selected historical episodes, and exposing the current portfolio to the most unfavourable developments in financial markets since 1993. (The calculations for historical episode scenarios use simplifying assumptions.)
2. Subjective stress tests, where the portfolios are exposed to scenarios for financial developments that are deemed particularly relevant at a particular time. The scenarios are inspired by the financial, the macroeconomic or geopolitical situation, or the current composition of the portfolio.
3. Sensitivity tests are conducted on interest rates, and include tests where rates, spreads and/or volatilities are shifted markedly. The sensitivities are measured both gross and net; the gross figures shedding light on exposure to situations where normal relationships between financial variables fail to hold.

#### **5.4 Compliance with requirements applicable to exposures in the trading book**

Annex VII, Part B of the European Parliament and Council Directive 2006/49/EG of 14 June 2006 on the capital requirements for investment firms and credit institutions outlines the requirements for systems and controls to provide prudent and reliable valuation estimates. Nordea complies in all material aspects with these requirements. Overall valuation principles are governed by policies and instructions applicable for the Nordea Group and independent Group staffs are responsible for the overall valuation process. The local risk control organisations in the individual business units are responsible for performing valuation controls in accordance to the policies and instructions applicable for the Nordea Group. The quality control framework is assessed by relevant Group functions as well as by Group Internal Audit on an ongoing basis.

The set-up for valuation adjustments in Nordea is designed to be compliant with the requirements in IAS39. Requirements in the annex not supported by IAS 39 are therefore not implemented. Nordea incorporates counterparty risk in OTC derivatives, bid/ask spreads and where judged relevant, also model risk.

## 6. Operational risk (pillar 1)

In this chapter, the management of operational risk is described.

Operational risk is inherent in all activities within the organisation, in outsourced activities and in all interaction with external parties. Solid internal control and quality management, consisting of a risk management framework, leadership and skilled personnel, is the key to successful operational risk management.

The main processes for managing operational risk are an ongoing monitoring through self-assessment and the documenting and registering of incidents and quality deficiencies. The analysis of operational risk-related events, potential risk indicators and other early-warning signals are in focus when developing the processes.

The mitigating techniques consist of business continuity plans together with crisis management preparedness and a broad insurance cover for handling major incidents. Mitigation efforts target reliability and continuity in the value chains rather than focusing on single units in the organisation. Special emphasis is put on quality and risk analysis in change management and product development.

An annual report on the quality of Internal Control in Nordea is submitted to the Board of Directors, incorporating all main issues on financial and operational risk. Each customer area, product area and group function is primarily responsible for managing its own operational risk. Group Credit and Risk Control develops and maintains a framework for identifying, assessing, monitoring and controlling operational risk and supports the line organisation in implementing the framework.

Information security, physical security and crime prevention are important components to management of operational risk. To cover this broad scope, the Group Security and the Group Compliance functions are included in Group Credit and Risk Control, and close cooperation is maintained with Group IT and Group Legal.

The techniques and processes for managing operational risk are structured around the risk sources as described in the definition of operational risk. This approach improves the comparability of risk profiles in different customer areas, product areas and group functions as well as and globally throughout the organisation. It also supports the focus on limiting and mitigating measures in relation to the sources, rather than the symptoms.

As described in chapter 3.3 the capital requirement for operational risk is in Nordea calculated according to the standardised approach, in which all of the institution's activities are divided into eight standardised business lines and the total capital requirement for operational risk is calculated as the sum of the capital requirements for each of the business lines for each entity. The risk for each business line is the beta coefficient multiplied by the average of the gross income where the beta coefficients differ between business lines and are in the range of 12% to 18%. The operational risk is updated on a yearly basis.

## 7. Disclosure of off-balance and securitisation (included in pillar 1)

In this chapter, Nordea discloses information about off-balance with focus on derivatives and securitisation.

Off-balance sheet items are divided into two different exposure types in accordance with calculation of credit risk RWA in the CRD:

1. Off-balance sheet items:

Main categories of off-balance sheet items are guarantees, credit commitments and unutilised portion of approved credit facilities.

2. Derivatives:

Financial instruments that derive their value from underlying interest rates, currencies, equities, credit spreads or commodity prices. Derivatives do not only result in counterparty risk measured within the credit risk RWA but also affect the market risk (see section 7.1 below).

For the different off-balance exposure types mentioned above, there are different possible values for the calculation base. For the off-balance items, the nominal value of the guarantee is applied with a credit conversion factor (CCF) for calculating the exposure at default (EAD). The CCF factor is 50% or 100% depending of the type of guarantee, i.e. lowering the risk weight compared with the same exposure on balance. Credit commitments and unutilised amounts are the part of the external commitment that has not been utilized. This amount forms the calculation base for which a CCF is used for calculating the EAD. The CCF factor is multiplied with the calculation base and is 0%, 20%, 50%, 75% or 100% depending of approach, product type and whether the unutilized amounts are unconditionally cancellable or not. For derivatives it is a combination of the market value and the nominal amount.

The overall capital requirements for these items are available in table 24, where the figures for derivatives stem from counterparty risk. It can be concluded that although off balance items have large exposure amounts, the effect on RWA is reduced due to the use of CCF in the calculation of EAD. Only 17% of the total RWA stem from off-balance sheet items and derivatives. Out of the total off-balance exposure, 63% relates to credit commitments, 23% of unutilised portion of approved facilities and 15% of guarantees. The credit commitments contain both revocable and irrevocable commitments.

Table 24: Exposure, RWA and capital requirements by exposure type, 31 December 2007 <sup>1)</sup>

EURm	On-balance sheet items <sup>2)</sup>	Off-balance sheet items	Derivatives	Total
Exposure	271,685	127,937	22,564	422,186
EAD	270,989	38,338	22,564	331,891
RWA	126,009	20,111	5,087	151,207
Capital requirement	10,080	1,609	407	12,096
Average risk weight	46%	52%	23%	46%

<sup>1)</sup> Basel 1 reporting entities are excluded from this table

<sup>2)</sup> On-balance sheet items includes Securities Financing

Off-balance sheet exposures can be found both in the banking book and in the trading book. The majority of derivatives are found in the trading book.

### 7.1 Risk in derivatives

Derivative contracts are financial instruments, such as futures, forwards, swaps or options that derive their value from underlying interest rates, currencies, equities, credit spreads or commodity prices. The derivative contracts are often OTC-traded, i.e. the terms connected to the specific contract are agreed upon on individual terms with the counterpart.

#### 7.1.1 General information about derivatives

Nordea enters into derivative contracts based on customer demand, both directly and in order to hedge positions that arise through such activities. Nordea, through Group Treasury also uses interest rate swaps and other derivatives in its hedging activities of the assets and liabilities on the balance sheet. Furthermore, Nordea may, within clearly defined restrictions, use derivatives to take open positions in its operations. Derivatives affect counterparty risk and market risk as well as operational risk.

#### Specific information about credit derivatives transactions

Nordea acts as an active intermediary in the credit derivatives market, especially in Nordic based names. Nordea is also using credit derivatives to hedge positions in corporate bonds and basket credit derivatives. Typical derivative products in credit derivatives trading are single name credit default swaps, but also basket credit derivatives, such as tranches in collateralized debt obligations (CDOs) and n'th to default baskets, are traded. Credit derivatives are only used to a very limited extent to mitigate the risk in Nordea's lending credit portfolio.

Credit derivatives transactions create counterparty risk equal to other derivatives transactions. As it is Nordea's policy to enter into bilateral, cross product closeout netting agreements with the counterparties, it is not possible to quantify the counterparty risk exposure arising from credit derivatives transactions isolated. Counterparties from which Nordea buys protection are typically subject to a

collateral agreement, thus the exposure is on daily basis covered by collateral placements.

Table 25 lists the total outstanding volumes of credit derivatives end 2007, split into bought and sold positions. To illustrate the business volume, the figures are provided on gross level, meaning no netting has been considered between bought and sold contracts in the same underlying name. In the Nordea Group, the credit derivative portfolio is booked in Nordea Bank Finland Plc.

Table 25: Credit derivatives volumes, 31 December 2007

Instrument EURm	Total Gross Notional Sold	Total Gross Notional Bought
Credit default swaps	40,822	41,413
Basket credit derivatives	4,147	4,768
<b>Total</b>	<b>44,969</b>	<b>46,181</b>

Like other derivatives, the credit derivatives affect both counterparty risk and market risk.

### 7.1.2 Counterparty risk

Counterparty risk is the risk that Nordea's counterpart in a FX, interest, commodity, equity or credit derivative contract defaults prior to maturity of the contract and that Nordea at that time has a claim on the counterpart. Counterparty risk in Nordea is subject to credit limits like other credit exposures and is treated accordingly. Counterparty risk arises mainly in the trading book, but also in the banking book due to hedging of external funding.

#### Pillar 1 method for counterparty risk

Nordea uses the mark-to-market method to calculate the EAD for counterparty risk in accordance with the credit risk framework in CRD, i.e. the sum of current exposure (replacement cost) and potential future exposure. The potential future exposure is an estimate, which reflects possible changes in the market value of the individual contract during the remaining lifetime, and is measured as the notional principal amount multiplied by a risk weight. The size of the risk weight depends on the contract's remaining lifetime and the underlying asset. Netting of potential future exposures on contracts within the same legally enforceable netting agreement is done as a function of the gross potential future exposure of all the contracts and the quotient between the net current exposure and the gross current exposure.

In table 26, the EAD as well as the RWA and capital requirement split on the exposure classes are available. As stated above, EAD equals the sum of current exposure and potential future exposure and as of December 2007 the potential future exposure is the major part of the EAD.

Table 26: Counterparty risk exposures<sup>1)</sup>, 31 December 2007

EURm	EAD	RWA	Capital requirement
Central governments and central banks	442	3	0
Institutions	17,182	2,997	240
Corporate	3,939	1,618	129
Other	1,001	469	38
<b>Total</b>	<b>22,564</b>	<b>5,087</b>	<b>407</b>

<sup>1)</sup> Exposure after closeout netting and collateral agreements

#### Internal capital and internal credit limits

Counterparty risk for internal credit limit purposes are calculated using a similar method to the pillar 1 method, but somewhat different risk weight and netting principles for calculation of the potential future exposure are applied. As of December 2007, the current net exposure was EUR 3,375m and the potential future exposure was EUR 21,988m in the internal counterparty risk framework.

For internal capital purposes (Economic Capital framework), the significant part of the counterparty risk exposure is calculated using a method referred to as Expected Positive Exposure. For the remaining part of the exposure, the method is similar to the method used for internal credit risk limits.

On traded OTC contracts, Nordea performs fair value adjustments to the counterparty risk exposures on portfolio level, which means that the market value of the contracts is adjusted to account for credit risk.

#### Mitigation of counterparty risk exposure

To reduce the exposure towards single counterparties, risk mitigation techniques are widely used in Nordea. The most common is the use of closeout netting agreements, which allow the bank to net positive and negative replacement values of contracts under the agreement in the event of default of the counterparty. In addition, Nordea also mitigates the exposure towards large banks, hedge funds and institutional counterparties by an increasing use of financial collateral agreements, where collateral on regular basis, typically daily, is placed or received to cover the current exposure. The collateral is largely cash (EUR, USD, DKK, SEK and NOK), but also government bonds and to a lesser extent mortgage bonds are accepted.

In table 27, information of how the counterparty risk exposure is reduced with risk mitigation techniques are available. As of December 2007 Nordea had 420 financial collateral agreements. The effects of closeout netting and collateral agreements are considerable, as 89% of the current exposure (gross) was eliminated by the use of these risk mitigation techniques.

Table 27: Mitigation of counterparty risk exposure due to closeout netting and collateral agreements, 31 December 2007

EURm	Current Exposure (gross)	Reduction from closeout netting agreements	Reduction from held collateral (net)	Current Exposure
<b>Total</b>	<b>29,800</b>	<b>23,979</b>	<b>2,446</b>	<b>3,375</b>

Nordea's financial collateral agreements do typically not contain any trigger dependent features, for example rating triggers. For a few agreements the minimum exposure level for further posting of collateral will be lowered in case of a downgrading. Separate credit guidelines are in place for handling of the financial collateral agreements.

Finally, Nordea also uses a risk mitigation technique based upon a condition in some of the long-term derivative contracts, which gives Nordea the option to terminate a contract at a specific time or upon the occurrence of specified credit related events.

### 7.1.3 Market risk

For all categories of derivatives, it applies that the market risk stemming from the derivative contracts is an integral part of Nordea's general setup for managing market risk. A prime purpose of derivatives is to hedge market risk from on balance sheet items. Therefore, when measuring Nordea's market risk, no distinction is made between risk from on-balance sheet items and derivatives. The RWA for market risk therefore contains risk stemming from derivatives, including credit derivatives. See chapter 5 for further description of Nordea market risk models and chapter 3 for RWA and capital requirement for market risk in Nordea.

## 7.2 Information about securitisation

According to the CRD, banks have securitisation positions whenever exposed to transactions where payments depend on the performance of an underlying pool of exposures and a subordination structure ("tranche structure") exists for determination of losses from the same pool. Under this broad definition, securitisation positions can arise at least in four ways, where the two first categories are securitisations in conjunction with lending to customers:

1. Banks originating securitisations by selling away the risk and return of some assets in their balance sheet. Nordea has not securitised assets from its ordinary lending portfolio (banking book).
2. Banks setting up special purpose entities ("SPEs"), which buy assets such as trade receivables from the bank's customers. SPEs issue short-term debt to fund these purchases and in many cases banks provide liquidity facilities. Nordea has set up one SPE entirely for the purpose to support trade receivable securitisation to core Nordic customers via Viking ABCP Conduit. Nordea has provided liquidity facilities of maximum EUR 1,122m and as of December 2007, EUR 623m was utilized. This transaction corresponds to RWA of EUR 212m and regulatory capital requirement of EUR 17m within the trading book.

The other two categories of securitisation include investor-driven products:

3. Banks arranging structured credit derivative transactions ("CDOs") in order to allow their customers to invest in new asset classes. SPEs in this business receive funds from investors and invest them in collateral assets. Nordea has arranged structured derivative transactions to allow customers to invest in structured products in the global credit markets. These transactions are known to investors as Mermaid and Kalmar transactions (in Finland, the transactions are known as credit linked notes issued by Nordea Pankki Suomi Oy). The total notional of bond issuance in this category was EUR 664m as of end of 2007. Nordea, in its role as market maker, occasionally buys back CDOs from investors. The RWA and capital requirement of these positions as well as other CDOs are included within the market risk framework of Nordea's trading book.
4. Banks arranging structured bonds transactions like Collateralised Mortgage Obligations ("CMOs") in order to meet specific customer preferences in terms of credit risk, interest rate risk, prepayment risk, maturity etc. A SPE purchases a pool of existing bonds (like mortgage bonds) and reallocates the risk through tranching a similar bond issue (CMOs). Nordea has arranged transactions via a Danish SPE. As of December 2007 the total notional of bond issuance was EUR 35m available to investors. Nordea, in its role as market maker, occasionally buys back CMOs from investors. The RWA and capital requirement of these positions are included within the market risk framework of Nordeas trading book.

The accounting consolidation principles of the above mentioned SPEs are disclosed in Note 1 item 5 in the Annual report.

## 8. Internal capital including other risk types

Nordea manages and measures other risk types not included in the RWA calculations. These are covered in the internal model for capital allocation (the Economic Capital model), which is used within the ICAAP. This chapter describes Economic Capital and some of these other risk types. The ICAAP is described in chapter 9.

### 8.1 Economic capital

Figures 4 and 5 show the composition of Economic Capital per risk type and business unit as of end year 2007. Total Economic Capital at the end of December 2007 is calculated as EUR 10.9bn.

Figure 4: Economic Capital distributed by risk type, 31 December 2007

Figure 5: Economic Capital distributed by area, 31 December 2007

Nordea calculates Economic Capital for the following major risk types: credit, market, operational, business and life insurance risk. Additionally, the Economic Capital models explicitly account for interest rate risk in the banking book, market risk in the investment portfolio, risk in Nordea's internal defined benefit plans, real estate risk and concentration risk. Nordea uses VaR and/or simulation modelling to determine capital requirements for interest rate risk in the banking book, market risk in treasury, risk in Nordea's internal defined benefit plans and real estate risk.

The primary differences between Economic Capital and the CRD are:

- In Economic Capital, the confidence level for all risk types is 99.97%, versus 99.9% in CRD.
- Credit risk (including counterparty risk) for corporate, institutions and retail exposures is calculated using Nordea's internal estimates of LGD and EAD, rather than the regulatory values in the FIRB approach.
- Exposures calculated using the standardised approach according to CRD are calculated on the basis of internal models in the Economic Capital framework, though the models have not yet been approved by the Financial Supervisory Authorities for use in the regulatory calculations.
- Concentration risk is also captured via the use of an internal credit risk portfolio model.

Economic Capital includes business risk to account for the residual volatility in historical profit and loss after adjustments for market, operational and credit risk. Economic Capital includes risk in the life insurance operations of Nordea Life & Pensions. Unlike pillar 1 regulatory capital, Economic Capital accounts for group level diversification benefits in Nordea's varied operations.

### 8.2 Interest rate risk for positions outside the trading book

Interest rate risk in the non-trading book consists of exposures deriving from the balance sheet (mainly lending to public and deposits from public) and from hedging the equity capital of the Group. The interest rate risk in the non-trading book is the major part of the structural interest income risk (SIIR). SIIR is the amount Nordea's accumulated net interest income would change during the next 12 months if all interest rates change by one percentage point.

The underlying interest rate exposure is calculated using the contractual maturity dates or the next repricing dates (if earlier than maturity date) of all interest sensitive assets, liabilities and off-balance sheet items. This is also applied to lending, where no prepayment adjustments are made. A major part of non-maturity accounts has a short-term repricing structure and therefore treated accordingly. However, a portion of these accounts is considered longer-term due to their behaviour.

The interest rate risk inherent in the non-trading book is measured on several ways on daily basis. Table 28 shows the sensitivity by currency of the exposures outside the trading book for a 200 bp parallel shift change in rates at the end of 2007. This test in terms of parallel shift is stipulated by the Financial Supervisory Authorities and is conducted in order to determine that the risk level is kept below the limit specified by the Financial Supervisory Authorities, otherwise Nordea has to take corrective actions. Nordea's interest rate risk inherent in the non-trading book was in 2007 within stipulated limits.

*Table 28: Interest rate risk in non-trading book, 31 December 2007, EURm*

Currency <sup>1)</sup>	Shock 1 (+ 200 bp)	
	Decline in earnings	Increase in earnings

SEK	53	
NOK		10
USD	40	
DKK	20	
Other	7	
<b>Total</b>	<b>362</b>	<b>10</b>

<sup>1)</sup> Breakdown by currency only as relevant

### 8.3 Liquidity risk

Liquidity risk is the risk of being able to meet liquidity commitments only at increased cost or, ultimately, being unable to meet obligations as they fall due.

Nordea's liquidity management is based on policy statements resulting in different liquidity risk measures, limits and organisational procedures. Policy statements stipulate that Nordea's liquidity management reflects a conservative attitude towards liquidity risk. Nordea strives to diversify the Group's sources of funding and seeks to establish and maintain relationships with investors in order to manage the market access. Nordea publishes adequate information on the liquidity situation of the Group to remain trustworthy at all times.

Nordea's liquidity risk management includes stress testing and a Business Continuity Plan for liquidity management. Stress testing is defined as the evaluation of potential effects on the liquidity situation under a set of exceptional but plausible events. The stress test should identify events or influences that could affect the funding need or the funding price and seek to quantify the potential effects. The purpose of stress tests is to supplement the normal liquidity risk measurement and confirm that the Business Continuity Plan is adequate in stressful events, and that the Business Continuity Plan properly describes procedures for handling a liquidity crisis with minimal damage to Nordea.

Group Treasury is responsible for managing liquidity in Nordea and for compliance with the group wide limits from the Board of Directors and CEO in GEM.

Liquidity risk management focuses on both short-term liquidity risk and long-term structural liquidity risk. In order to measure the exposure on both horizons, a number of liquidity risk measures have been developed covering all material sources of liquidity risk. For example, in order to avoid short-term funding pressure, Nordea measures the funding gap risk, expressed as the expected maximum accumulated need for raising liquidity in the course of the next 14 days. The structural liquidity risk of Nordea is measured and limited by the net balance of stable funding, which is defined as the difference between stable liabilities and stable assets.

### 8.4 Other risk types

Business risk represents the earnings volatility inherent in all businesses due to the uncertainty of revenues and costs due to changes in the economic and competitive environment. The main risk drivers are reputation risk, strategic risk and indirect effects as structural interest income risk. Business risk is calculated based on the residual volatility in historical profit and loss time series after adjustments for market, operational and credit risk.

Concentration risk is the credit risk stemming from not having a well diversified credit portfolio, i.e. the risk inherent in doing business with large customers or being over-exposed in particular industries or regions. Through the use of a credit risk portfolio model which considers exposures by industry and geography, the concentration risk can be identified. As Nordea calibrates the Economic Capital credit risk formulas to the results of its portfolio model estimation, the industry or region concentration impact is allocated pro rata over the entire portfolio. Additionally, Nordea's Economic Capital credit risk formulas consider exposure to large customers by applying a single-name concentration add-on.

## 9. Capital adequacy conclusions

Nordea strives to attain efficient use of capital with the focus on achieving profitability targets and optimising risk and return to the shareholders.

### 9.1 Capital ratios

The transition phase of the new CRD creates a need to manage the institution using a variety of capital measurements and capital ratios. The table 29, shows that the regulatory transition rules comprise a floor on Nordea's capital requirement when compared to the pillar 1 minimum requirements. This difference will fluctuate through the transition period as the floor gradually decreases and Nordea receives approval for internal rating based models for its retail portfolio and other portfolios. At present, this difference is EUR 33.1bn expressed as RWA and EUR 2.6bn expressed as regulatory capital requirement. Nordea aims at a tier 1 capital ratio above 6.5% and a total capital ratio not lower than 9.0%. The capital ratio was 9.1% at the end of 2007 and 9.8% at the end of 2006. These ratios are also dependent on the CRD transition and Nordea will maintain its target capital levels through dividend and share-buy-back policy as well as through sub-ordinated capital management.

In addition to regulatory requirements, Nordea has internal capital requirements based on the Economic Capital framework, which includes risk in Nordea's life insurance operations. As such, the Economic Capital is compared to the capital base including the deduction for the investment in the life insurance operations (NLP).

Table 29: Capital adequacy ratios, EURbn

	31 December 2007
RWA with transition rules	204.6
RWA Basel II (pillar 1) before transition rules	171.5
Regulatory Capital requirement with transition rules	16.4
Economic Capital (EC including NLP)	10.9
Capital base	18.7
Tier 1 capital	14.2
Tier 1 ratio with transition rules (%)	7.0%
Tier 1 ratio before transition rules (%)	8.3%
Capital ratio with transition rules (%)	9.1%
Capital ratio before transition rules (%)	10.9%
Capital base / Regulatory Capital requirement before transition rules (%)	136.0%
Capital base + NLP capital / Economic Capital (%)	185.9%

### 9.2 Strategies and methods for maintaining the capital adequacy

Nordea's ability to maintain minimum capital requirements is reviewed regularly by the Capital Planning Forum (CPF). The CPF, headed by the CFO, was established in August 2004 as the forum responsible for coordinating capital planning activities within the Group, including regulatory, internal and available capital. Additionally, the CPF and its members review future capital requirements in the assessment of annual dividends, share repurchases, external and internal debt and capital injection decisions. The CPF considers information on key regula-

tory developments, market trends for subordinated debt and hybrid instruments and reviews the capital situation in the Nordea Group and in key legal entities. In the CPF the CFO decides, within the mandate given by the Board of Directors, on issuance of subordinated debt and hybrid capital instruments. Meetings are held at least quarterly and on request by the CFO.

#### 9.2.1 ICAAP

Pillar 2 in the CRD, or the Supervisory Review Process (SRP), covers two main processes: the Internal Capital Adequacy Assessment Process (ICAAP) and the Supervisory Review and Evaluation Process (SREP). The purpose of the ICAAP is for each institution to review the management, mitigation and measurement of material risk to assess the adequacy of internal capital and to determine an internal capital requirement reflecting the risk appetite of the institution. The purpose of the SREP is to ensure that institutions have adequate capital to support all the risk in their businesses and to encourage institutions to develop and use better risk management techniques in monitoring and measuring risk.

In 2007, Nordea's tier 1 capital and capital base exceeded the regulatory minimum requirements outlined in the CRD. Considering the results of capital adequacy stress testing and capital forecasting, Nordea assesses that the buffers held for regulatory capital purposes are sufficient and that Nordea's internal capital targets of 6.5% for tier 1 capital and 9.0% for total capital are adequate given its current risk profile and capital position relative to Nordea's implementation timetable.

Nordea uses its internal capital models, Economic Capital, when considering internal capital requirements with and without market stress. As a number of pillar 2 risk types exist within Nordea's current Economic Capital framework; interest rate risk in the banking book, market risk in treasury's investment portfolios, risk in Nordea's internal defined benefit plans, real estate risk, concentration risk, counterparty risk and business risk. Nordea uses its existing internal capital measurements as the basis for any additional capital buffers, subject to the judgement of the aforementioned third parties. Nordea considers the results of its capital adequacy stress testing, along with Economic Capital and RWA forecasts, to determine its internal capital requirement and to ensure that the bank is adequately capitalised in stress scenarios reflecting Nordea's risk appetite. The impact of stress testing on Nordea's capital policy increases as additional parts of the portfolio begin to use IRB models and, thus, become more sensitive to customer credit ratings, collateral valuations and other capital parameters during changes in the economic cycle or periods of economic stress.

Nordea's policy is to ensure that the capital base exceeds the internal capital requirement. Remaining buffers are expected to be reduced via dividends and/or share buy-backs as the regulatory requirement is reduced with the implementation of IRB models and removal of CRD transition rules and capital floors.

### 9.3 Capital base and conditions for items to be included in the capital base

A summary of items included in the capital base is available in table 30. Capital base (referred to as own funds in the CRD) is the sum of tier 1 capital and tier 2 capital after deductions. Tier 1 capital is defined as capital of the same or close to the character of paid-up capital, eligible reserves and also a limited part (up to 15% of tier 1) instrument hybrid capital loans (perpetual loans). Hybrid capital loans may be repaid only by decision of Nordea and with the permission of the Swedish Financial Supervisory Authority. Profit may only be included after external audit and after deduction of proposed dividend. Goodwill, other intangible assets and deferred tax assets are deducted from tier 1. Tier 2 capital includes two different types of subordinated loan capital; perpetual loans and dated loans. The total tier 2 amount may not exceed tier 1 and dated tier 2 loans may not exceed half the amount of tier 1. The limits are set after deductions. Such deductions are investment in insurance and other financial companies. Half the amount should be deducted from tier 1 capital and the remaining half from the sum of tier 1 and tier 2. A transitional rule, in effect until 2012, allows the invested capital in insurance companies to be deducted from the sum of tier 1 and tier 2 capital.

Nordea's calculation of capital base is in accordance with the CRD and the Swedish legislation. The differences between expected loss and provision made for the related exposures are adjusted for in the capital base. The negative difference (when EL is larger than provision) is included in the capital base as shortfall. According to the rules in CRD the shortfall amount shall be deducted from the capital base and be divided into both tier 1 capital and tier 2 capital. For the purpose of CRD transitional rules calculations of the shortfall is under Swedish regulation deducted from the RWA to be neutralised in a Basel I perspective. A positive difference (provisions exceed expected loss) can be included in tier 2 capital with certain limitations.

Generally, Nordea Group has the ability to transfer capital within its legal entities without material restrictions. International transfers of capital between Nordea's legal entities are possible with the acceptance of the local regulator.

As of end year 2007, Nordea holds EUR 5,4bn in Dated Subordinated Debenture Loans, EUR 0,7bn in Undated Subordinated Debenture Loans and EUR 1,4bn in Hybrid Capital Loans.

Table 30: Summary of items included in capital base

EURm	31 December 2007
<b>Calculation of total capital base</b>	
<b>Tier 1 capital</b>	
Paid up capital	2 597
Share premium	
<b>Eligible capital</b>	<b>2,597</b>
Reserves	11,060
Minority interests	10
Income (positive/negative) from current year	3,121
<b>Eligible reserves</b>	<b>14,191</b>
<b>Tier 1 capital (before hybrid capital and deductions)</b>	<b>16,788</b>
<b>Hybrid capital loans subject to limits</b>	<b>1,409</b>
Proposed/actual dividend	-1,300

<b>Deductions from Tier 1 capital</b>	<b>-3,967</b>
<b>Tier 1 capital (net after deduction)</b>	<b>14,230</b>
– of which hybrid capital	1,409
<b>Tier 2 capital</b>	
Securities of indeterminate dur. and other instr.	664
Subordinate loan capital	5,406
Other additional own funds	5
<b>Tier 2 capital (before deductions)</b>	<b>6,075</b>
Hold in cr and fin inst. amount more th 10% ca	-80
Participations hold in insurance undert., reinsurance	-1,535
IRB provisions excess (+) / shortfall (-)	-30
Other deduction	0
<b>Deductions from Tier 2 capital</b>	<b>-1,645</b>
<b>Tier 2 capital (net after deductions)</b>	<b>4,430</b>
<b>Capital base</b>	<b>18,660</b>

<sup>1)</sup> The term provision is used in the CRD when defining the basis for shortfall/provision excess. In Nordea, the terminology allowances are used when referring to the same treatment.

## 10. List of abbreviations

ADF	Actual Default Frequency
AIRB	Advanced Internal Rating Based approach
ALCO	Asset and Liability Committee
CCF	Credit Conversion Factor
CDO	Collateralised Debt Obligation
CEO	Chief Executive Officer
CFO	Chief Financial Officer
CPF	Capital Planning Forum
CRD	EU's Capital Requirements Directive
CRO	Chief Risk Officer
EBITDA	Earnings before Interest, Tax, Depreciation and Amortisation (of goodwill or other intangible assets)
ECC	Executive Credit Committee
EEA	European Economic Area
EAD	Exposure at Default
EC	Economic Capital
EL	Expected Loss
EU	European Union
FFFS	Finansinspektionens Författningssamling (The Swedish Financial Supervisory Authority's directive)
FIRB	Foundation Internal Rating Based approach
FX	Foreign Exchange
GCC	Group Credit Committee
GEM	Group Executive Management
IAS	International Accounting Standard
ICAAP	Internal Capital Adequacy Assessment Process
IFRS	International Financial Reporting Standard
IRB	Internal Rating Based approach
LGD	Loss Given Default
M	Maturity
NLP	Nordea Life and Pensions
n'th default	The default of the order n (1, 2, 3...or n) in a portfolio (in the context of a credit default instrument)
OTC	Over The Counter (derivatives)
PD	Probability of Default
RW	Risk weight
RWA	Risk Weighted Amount
S&P	Standard & Poor's
SRP	Supervisory Review Process
SREP	Supervisory Review and Evaluation Process
SIIR	Structural Interest Income Risk
SME	Small and Medium-sized Enterprises
SPV	Special Purpose Vehicle
VaR	Value at Risk
